*CLEAR*

1 second  
setting time

5-6 weeks  
retention

**SENSITIVE**  
**ADHESIVE**

7-9 seconds  
setting time

2 weeks  
retention

## THANK YOU FOR CHOOSING ELLEEBANA LASH EXTENSIONS ADHESIVES.

---

We want to share with you some tips for use to help you get to know the product you are using. Elleebana adhesive is an ISO grade adhesive that is vegan and not tested on animals. This adhesive is a cyanoacrylate based product, which means there is a short shelf life and an even shorter after opening life as the product will begin to polymerize after exposure to air or moisture.

**CONSISTENCY** – The consistency of this adhesive is thin – perhaps more so than what you might be used to. This thin consistency aids to prevent overloading the lash line with unwanted adhesive. Please ensure you have a small bead on the end of your lash before attaching if you are performing classic lash applications.

**STORAGE** – Always away from sunlight, heat, moisture and ensure the lid and tip of the bottle is cleaned and well-sealed between uses. Storing in an airtight container with the silica pack enclosed in your bag will help to draw away any additional moisture and is recommended.

Do not store Elleebana's adhesive in the fridge after the product has been opened. Once the seal has been broken if the product is placed in the fridge condensation will form in and on the bottle and the moisture in the fridge will begin the curing process and change the structure of the adhesive. You can store the adhesive in the fridge or freezer before opening to prolong a shelf life (not after opening) but be sure to thaw the bottle well before opening by allowing the bottle to sit at room temperature for a minimum of 4 hours.

**BEFORE USE** – You do not want to shake your adhesive with the lid on it as this will result in the adhesive getting on the underside of the lid and the two becoming bonded together. Instead remove the lid and use the small red pin lid included in the pack, then shake your adhesive for a minimum of 1 minute before use. This prepares the consistency of the adhesive and allows the product to be dispensed without separation. If you lose the pin lid, apply sticky tape or aluminium foil over the opening and then apply your finger and start shaking.

**ROOM PREPARATION** – Elleebana's adhesive has the ideal humidity of 45 – 60% relative humidity and a room temperature of between 20 – 28 degrees Celsius. Outside of this environment the adhesive may cure slower or faster than desired.

**BATCH NUMBERS** – Each adhesive comes with a batch number – without this batch number purchase of your product is void and no claim for faulty product can be made. Do not remove the batch number from the bottle.

**EXPIRY DATE** – The expiry date of Elleebana Power Bond Black and Super Pro Black will be found on the bottom of the bottle with the batch number. Super Pro Clear, Power Bond Clear and Sensitive Adhesive will have an expiry date sticker on the back of the packet.

**TIP** – Write the date you opened your adhesive on your bottle as a reminder to re-order when you know your adhesive is getting old. All adhesives have an optimal usage time of 6 weeks and up to 3 months if stored and cared for well after opening.

You can also use the additional cap clearer to tidy and clear the nozzle of your product to ensure when you are resealing the bottle the nozzle is clear and clean of any adhesive residue.
